Query: (liquid bed, powder bed, deposition processes), or composite layup (autoclave, compression, or liquid molding). one or more metal plating layers 246 may then be applied to selected outer surfaces of the polymer substrate 244 according to a next block 252. the block 252 may involve first suitably activating and metallizing the selected outer surfaces of the polymer substrate 244 using techniques that are well - established in the industry. once the selected outer surfaces have been suitably activated and metallized, the metal plating layers may be deposited using metal deposition methods apparent to those having ordinary skill in the art such as electrolytic plating, electroless plating, electroforming, or another suitable deposition method. alternatively, the metal plating 246 may be applied to selected outer surfaces of the polymer substrate 244 as a coating by spraying or other deposition processes. based on the known critical temperature or set of critical temperatures of the bond between the metal plating 246 and the polymer substrate 244 (or the glass - transition temperature of the polymer substrate 244), a suitable temperature - indicating coating 242 may be selected according to a block 254, as shown. according to a next block 256
